

## WELCOME

Congratulations on your purchase of the most powerful rodent deterrent on the market today. The Mouse Blocker 1000x was designed after years of work and testing to design the best and most advanced MouseBlocker yet designed for buildings. The Mouse Blocker 1000x produces powerful ultrasonic sounds that distrust rodents. This heavy percussive sound makes the area uncomfortable for a rodent to be in.

## ABOUT MOUSE BLOCKER

MouseBlocker was founded in the United States in 2010 to create the best protection for vehicles powered by 12 volts, vehicles in storage with access to 120 volt AC power and home garages, basements and other areas in need of protection. We pride ourselves in being pioneers in this industry. We work everyday to improve our products and to provide the most effective mouse deterrent products on the market.

### 1. Function

The MouseBlocker 1000x uses modern micro-electronics technology outputting 2 types of special ultrasonic waves simultaneously. These waves act upon the hearing and nervous system of rodents making them unpleasant and uncomfortable. This unit is designed to drive the mice away from protected areas. The frequencies output from the 1000x are constantly changing and alternating eliminating the chance of rodents adapting to the sound.

### 2. Coverage Area

The MouseBlocker 1000x is a very high output device covering up to 1000 square feet with a clear line of site. Since the unit operates off sound, the noise will not go thru walls or solid objects. Place the unit with speakers facing open space free of obstructions

### 3. Operation Methods

Plug one end of the included power cord into the power socket on the left rear side of the unit. Plug the other end of the power cord into any available 110v power outlet. After plugging the unit into power, it will start working immediately. The green power light should be on solid and the blue ultrasonic light should be flashing/blinking according to the sound output.

Testing output: There is a green test button on the back of the unit. Pressing this button will amplify the ultrasonic noise to an audible level. This noise is very loud and confirms that the microprocessor is working properly.

### 4. Precautions

1. Never use the device outdoors, in high temperature locations or damp locations.
2. The MouseBlocker 1000x should be used continuously without stopping to be effective.
3. There should be no obstructions in front of the unit. Ultrasonic noises will not pass thru hard objects.
4. There are four loud speakers installed in three directions so the device should be installed along a wall, with the back facing a wall for optimal effectiveness.
5. It is normal if the device gets warm to the touch.
6. The effects of this unit will be seen immediately as soon as the device is powered on. The unit will be most effective after using it continuously for 3-4 weeks. Sometimes the mice may be more active during the beginning of use showing that the rodents are irritated. After using the unit for a prolonged period of time the mice will begin to disappear.

### 5. Unit Technical Specifications

AC Power Voltage: AC 120v 60hz

Power Consumption: 25Watts

Frequency Coverage: 25-45Khz Intermittent at 160 Seconds
